

The FDA says Americans do NOT have a right to know which foods are genetically modified.

MONSANTO MISSION STATEMENT:

"Control the food supply and you control the People." United Nations Agenda 21 and Monsanto -- Working together to control the world one nation at a time.

“Monsanto evil empire” is the name used to describe the corporation by most people in about 50 countries. For them, the company is the incarnation and plenitude of evilness. From Agent Orange to GMO seeds (Monsanto GMO Seeds), Monsanto is bad with capital B. Let’s consider top 7 evils facts about Monsanto to find out why critics in over 50 countries describe the agriculture company as the "most evil corporation in the world." Monsanto Africa, Monsanto conspiracy, Monsanto corn, Monsanto cancer milk, bee apocalypse Monsanto is a company specializing in agricultural biotechnology, with headquarters located in Creve Coeur, Missouri. Founded in 1901 by John Francis Queeny, it produced food additives like saccharin and vanillin, expanded into industrial chemicals like sulfuric acid and PCBs in the 1920s. In the 1940s, Monsanto was a major producer of plastics such as polystyrene and synthetic fibers. It is notably the first company to have produced visible LED mass.

Monsanto drone bees, Monsanto food, Monsanto illuminati, Monsanto is bad, Monsanto Alex Jones, In the early 1980s, the potential of plant biotechnology causes a strong reorganization of crop protection products and seed market, once separated. Monsanto then disengages from the chemical industry to move towards biotechnology and seed via an intensive buyback policy. And then the company merged with Pharmacia in 1999 and separated in 2002. Monsanto also produced PCBs and Agent Orange, aspartame and bovine recombinant growth hormone.

Other agricultural chemical companies would do the same in the 1980s and 1990s, which led to the founding of the largest companies in the field: Syngenta, Dow AgroScience and Pioneer Hi-Bred International, Inc. All these giant companies are present on the seed market today, GMOs, and pesticides (plant protection products). Monsanto, Monsanto GMO, Monsanto evil, Monsanto Agent Orange, Monsanto cancer, Monsanto and GMOs Monsanto is the producer of glyphosate, a broad-spectrum systemic herbicide used to kill weeds which is marketed under the brand name "Roundup" and remains the most widely used herbicide in the world. It has been a decade since Monsanto is world number 1 on the seed market and the first genetic transformation event provider used for the production of genetically modified seeds – GMO seeds.

Obama signs Monsanto Protection Act! It's Time to Label GMOs! We regret to inform you that President Barack Obama has signed H.R. 933,

which contained the Monsanto Protection Act, into law. President Obama knowingly signed the Monsanto Protection Act over the urgent

pleas of more than 250,000 Americans who asked that he use his executive authority to veto it.

President Obama failed to live up to his oath

to protect the American people and our constitution.

Today we're calling on President Obama to issue an executive order to call for the mandatory labeling of genetically engineered foods. Not

only is GMO labeling a reasonable and common sense solution to the continued controversy that corporations like Monsanto, DuPont and

Dow Chemical have created by subverting our basic democratic rights, but it is a basic right that citizens in 62 other countries around the

world already enjoy, including Europe, Russia, China, India, South Africa and Saudi Arabia.

Join us in demanding mandatory labeling of GMO foods. Now's the time!

<http://action.fooddemocracynow.org/sign/>

[obama_signs_monsanto_protection_act_time_to_label_gmos/](http://action.fooddemocracynow.org/sign/obama_signs_monsanto_protection_act_time_to_label_gmos/)

5 Appalling Facts About The Monsanto Protection Act Obama Signed Into Law

Read more at <http://planetsave.com/2013/04/02/five-appalling-facts-about-the-farmer-assurance-provision-the-monsanto-protection-act/#u31rMHbmi4ivvC6w.99>

Seeds Of Death is a Gary Null Production all rights belong to him. The truth belongs to all of us! The leaders of Big Agriculture--Monsanto, DuPont, Syngenta--are determined that world's populations remain ignorant about the serious health and environmental risks of genetically modified crops and industrial agriculture. Deep layers of deception and corruption underlie

both the science favoring GMOs and the corporations and governments supporting them.

This award-winning documentary, Seeds of Death, exposes the lies about GMOs and pulls back the curtains to witness our planet's future if

Big Agriculture's new green revolution becomes our dominant food supply.

A Question and Answer fact sheet deconstructing Monsanto's GM claims and Big Agriculture's propaganda to accompany the film is available online:

<http://prn.fm/2013/05/24/gary-null-an>

IMPORTANT

Olean (Olestra) Found in 'Fat Free' Foods - olean isn't processed by the human body, and can lead to diarrhea, while interfering with the absorption of important fat-soluble vitamins such as A,D, E, and K.

Go for some baked potato chips if you're looking for a healthier chip option, and just skip the olean.

Farm-Raised Salmon - If you haven't heard, antibiotic resistance is on the rise, and it is partly due to toxic chemicals like glyphosate, but especially due to antibiotic overuse in our food.

Farm raised fish are also pumped full of chemicals to make them grow bigger faster, and even to be a more pleasant color to consumers

Drinks Made with Flame-Retardants - contain brominated vegetable oil (BVO), used in the US in products like Mountain Dew in order to keep the 'citrus' flavor evenly distributed throughout the soda.

Originally, chemical companies made BVO as a flame retardant.

It can cause reproductive problems, depress the nervous system, interrupt the endocrine system, and create behavioral problems (especially in children).

160 Countries Banned Ractopamine Meat - the US FDA says this drug is just fine.

Ractopamine is a drug used to reduce fat content to create leaner meats in pigs, cattle, and turkeys. The US doesn't test for this chemical in our meat, even though it causes chromosomal changes, heart disease, hyperactivity and more.

- Want to avoid it? Grass-fed beef is naturally lean, and is a much better alternative.

Milk and Dairy Containing rGBH - This hormone given to dairy cows to make them produce more milk is so vile that the EU, Canada, Israel, New Zealand, and Australia have all banned it – a total of 27 countries have in fact said that they will not put Monsanto's genetically engineered hormone in their dairy products.

The synthetic hormone is created using molecules and DNA sequences that are a result of molecular cloning, which has been linked to breast and gastrointestinal cancer.

Genetically Modified Organisms (GMO's) - The list of foods that contain GMOs in the US is long, while hundreds of countries have bans on GMOs.

The US is one of the only industrialized nations that doesn't at least label.

A minimum of 165 million acres are currently planted with GMOs in the US. In Europe all products containing more than .9 percent GMO are labeled as such

– but no such luck in the US!

1. Aspartame

According to the EPA, aspartame is a chemical that causes neurotoxicity. Keep in mind that that's the United States Environmental Protection Agency — a government agency. Regardless, the FDA continues to rubber stamp its use.

Aspartame is made from aspartate, methanol, and phenylalaine. Once ingested, the body breaks aspartame down into these constituent parts. Most notably, methanol is converted into formaldehyde. The US Department of Labor considers formaldehyde a toxic and hazardous substance that should not be ingested.

Recent research has demonstrated highly carcinogenic affects from aspartame consumption. [2]

Additional research could not dismiss aspartame's role in leukemia and non-Hodgkins lymphomas.

[3] Entire books have been written about the dangers of aspartame.

In the quest for healthy living, this toxic, lab-created chemical tops any list of foods and ingredients to avoid!

2. Corn

The agribusiness cartels have assured us for years of their products safety and the mainstream media have smiled and winked right alongside them. However, now, even MSN is now reporting that GMO corn may be toxic. [4] Several studies have shown regular dietary consumption of Bt-corn (maize), the GMO version of corn, leads to serious health problems and negatively effects the kidney and liver (the dietary detoxifying organs), as well as in the heart, adrenal glands, and spleen. [5] [6]

Eating organic corn may be one way to eliminate exposure to this dangerous GMO. As you will see below, corn appears in many more forms, making avoidance an exercise in awareness.

3. Sugar Beets

Of the nearly 130 million metric tons of sugar produced globally every year, sugar beets constitute nearly 35% of that sugar (the remaining amount coming from sugar cane). [7] These sugar beets are used to produce sucrose. [8]

Unfortunately, they struggle to survive competition from weeds. So a glyphosate (Roundup) version was created. [9] That way farmers could dump Roundup on the fields of sugar beets to kill off the weeds without killing the sugar beets. Great idea — in addition to the glyphosate DNA, the plants are repeatedly coated with toxic chemicals during their growing cycle.

The best way to avoid sugar beets is to avoid products with sucrose (sugar), or any product that doesn't specify sweeteners like organic agave or raw honey.

4. HFCS (High Fructose Corn Syrup)

First, HFCS is made from corn, which is likely to be a GMO strain. It then goes through a process that converts corn into corn starch...which then is converted into corn syrup in a process involving bacterial enzymes and fungus. Finally, another bacterial enzyme is added to the process to produce fructose. This is not a natural process and does not yield a natural product.

Mercury has been found in HFCS as a result of the manufacturing process. [10] Does HFCS lead to

health problems? Possibly, researchers from Princeton and Oxford have linked HFCS to weight gain and Type II diabetes. [11] [12]

To summarize, HFCS starts as a GMO, contains mercury, and has been linked to weight gain and Type II diabetes. Just avoid it.

5. Soy (lecithin)

Soy beans are perhaps one of the most prevalent GMO products in fields today. Soy has been associated with a wide range of health problems and GMO soy has been linked to pancreatic problems. [13]

Soy lecithin isn't even a choice soybean product, it's a waste product from the processing of crude soy oil. It typically contains solvents and pesticides. Researchers have also found soy lecithin to contain allergens that have wide ranging health impacts. [14]

As a rule, avoid soy unless it is organic and fermented (such as in miso or natto). And make sure to avoid anything containing soy lecithin, the soy product constructed from the sludgy glop created during the creation of soy oil.

6. Corn Starch

Corn starch is a highly processed corn product made from corn – genetically modified (GM) corn. It offers no nutritional value and carries all the dangers associated with GMO foods. It is used as an additive in many products and as a processed food, it creates digestive problems. The problems with corn starch have been known about since the 1970s. With the introduction of GMO corn, the problems have only increased.

7. Tomatoes

When tested, genetically modified tomatoes have been found to have less antioxidant activity than their natural counterparts. [15] As is the case with GMOs, the genetic modifications result in overall reduced nutritional value.

8. Sausage

Most sausage contains corn syrup or corn syrup solids, in addition to the other preservatives. That's right, the hot dog or Italian sausage you enjoy – even just once in a while – likely contains a GMO. If you choose to eat sausage of any type, avoid the pre-packaged kind. Your best bet is to purchase from a local butcher who specializes in locally grown, organic, free-range meats.

9. Ice Cream

This delicious summer-time treat typically features a range of HFCS, corn syrup and corn starch, plus rGBH. Unless the brand you buy is organic or home-made from organic ingredients, each spoonful of ice cream likely contains plenty of genetically-modified DNA and bovine growth hormones.

10. Non-organic and Synthetic Vitamins

Many vitamins, including top children's vitamins, use 'vegetable' products as a base for the vitamin. Many of these 'vegetables' come from corn and soy products; many also contain aspartame and hydrogenate oils. Look for vitamins that are specifically organic or non-GMO.

11. Infant Formula

Milk that contains rGBH and genetically modified soy constitute the foundation for most infant formulas, unless they specifically state they are organic. Research has found that infant diets including formulas that contain these GMOs contribute to chronic, long-term health conditions. [16]

12. Beef

Beef feed may contain GMO alfalfa, corn and soy. When cows eat GMOs, they get into their system and become part of the meat. If you're going to eat beef, only consume organic, grass-fed beef.

13. Milk

Why let nature do things naturally when Monsanto's recombinant Bovine Growth Hormone (rGBH) can be injected right cows to increase milk output. Never mind that hormones associated with rGBH have been found present in milk distributed for human consumption. Or that studies have also found milk from cows injected with rGBH contain reduced amounts of healthy fatty acids. [17] Or that these cows are more likely to have mastitis, an utter infection that can lead to blood and pus in the milk. Yuck.

You can buy organic milk or goat milk and avoid bovine growth hormones. However, to keep all bovine growth hormones out of the diet, you also need to watch out for foods that contain milk products, as these may come from hormone-injected cows.

14. Alfalfa

Although GMO alfalfa planting had been halted, as of this year, GM alfalfa returns to the fields. [18] Alfalfa is the backbone of the dairy industry, both organic farmers and industry groups. So dairy, beef, and alfalfa will all be affected. As an insect pollinated plant, cross pollination of GMO plants and non-GMO plants will likely result.

15. Vegetable Oil

Vegetable Oil typically comes from corn, soybean, cotton, or canola oils. All of these crops have been genetically modified to withstand being doused by Roundup. Unless the vegetable oil states it is organic, assume it may contain some degree GMOs.

16. Canola Oil

Canola oil gets its own category due to its prevalent use. Aside from questions about an oil made from a plant toxic to human consumption, the rapeseed has been genetically altered. As of 2009, 90% of Canada's rapeseed crop was 'herbicide-tolerant'. [19] When it comes to cooking oils, the best option is to find products specifically designated non-GMO.

17. Margarine and Shortening

These are another form of vegetable oil and contain all the GMO problems the vegetable oils contain. To avoid GMOs from margarine, organic butter may be an option.

18. Hawaiian Papaya

This type of genetically modified papaya primarily affects those living on the west coast. Its GMO attribute is that its a virus-resistant plant specific to Hawaii and the areas that import papaya from Hawaii. This plant contains DNA from the Ringspot virus, as do individuals who choose to eat it.

19. Squash

Many squash varieties have been genetically modified to fight off the diseases that can affect them. When it comes to squash, buy organic.

20. Flax

GMO flax has been grown (illegally, for what it's worth) in Canada. The extent of Canadian contamination has not yet been determined. Reports also indicate that the GM flax has been exported around the world where contamination has occurred. [20] Because of the environmental

catastrophe of this rogue GM strain, identify the source of the flax used before you buy. Flax from Canada may be infected, as well as from many areas of the EU.

21. Cotton

Like corn and soy, cotton has been designed to resist pesticides. It is considered food because its oil can be consumed. Its introduction in Chinese agriculture has produced a chemical that kills cotton bollworm, reducing the incidences of pests not only in cotton crops but also in neighboring fields of soybeans and corn. Incidentally, thousands of Indian farmers suffered severe rashes upon exposure to BT cotton.

22. Papaya

Like corn and soy, cotton has been designed to resist pesticides. It is considered food because its oil can be consumed. Its introduction in Chinese agriculture has produced a chemical that kills cotton bollworm, reducing the incidences of pests not only in cotton crops but also in neighboring fields of soybeans and corn. Incidentally, thousands of Indian farmers suffered severe rashes upon exposure to BT cotton.

23. Rice

Like corn and soy, cotton has been designed to resist pesticides. It is considered food because its oil can be consumed. Its introduction in Chinese agriculture has produced a chemical that kills cotton bollworm, reducing the incidences of pests not only in cotton crops but also in neighboring fields of soybeans and corn. Incidentally, thousands of Indian farmers suffered severe rashes upon exposure to BT cotton.

24. Rapeseed

In Canada, this crop was renamed canola to differentiate it from non-edible rapeseed. Food stuff produced from rapeseed includes rapeseed oi (canola oil) l used to process cooking oil and margarine. Honey can also be produced from GM rapeseed. German food surveillance authorities discovered as much as a third of the total pollen present in Canadian honey may be from GM pollen. In fact, some honey products from Canada were also discovered to have pollen from GM rapeseed.

25. Potatoes

Mice fed with potatoes engineered with *Bacillus thuringiensis* var. *Kurstaki* Cry 1 were found to have toxins in their system. Despite claims to the contrary, this shows that Cry1 toxin was stable in the mouse gut. When the health risks were revealed, it sparked a debate.

26. Peas

Peas that have been genetically modified have been found to cause immune responses in mice and possibly even in humans. A gene from kidney beans was inserted into the peas creating a protein that functions as a pesticide.

The best advice: steer clear of them altogether.

.....
GMOs remain in “Natural” foods all over the country.

Consumer Reports found that some “Natural” products contained similar amounts of GMOs as their counterparts without a natural label. For instance, they found substantial quantities of GMO corn or GMO soy in popular “Natural” foods such as Kashi GoLean Honey & Cinnamon hot cereal (owned

by Kellogg's), Utz All Natural Multigrain Tortillas, and Nature Valley Crunchy Oats 'N Honey Granola Bars (owned by General Mills).

==From Consumer Reports – Products guilty of using GMOs (A-Z):==

Monsanto-Free Seed Companies

<http://worldtruth.tv/monsanto-free-seed-companies/>

The companies listed below have signed the Safe Seed Pledge for 2012. Many of the GMO Seed Companies are owned by PHARMACEUTICAL COMPANIES. This should tell us something. Created in 1999, the Safe Seed Pledge helps to connect non-GM seed sellers to the growing market of concerned gardeners and agricultural consumers.

The Pledge allows businesses to declare that they “do not knowingly buy or sell genetically engineered seeds,” thus assuring consumers of their commitment.
